

Lab 0.2

Write and Run Python

Z. Hutchinson
zachary.s.hutchinson@maine.edu

August 31, 2021

Task

Open an empty Python file in your code editor and name it, *yourlastname_lab0.py*. Add the following three lines of code. It is not important that you understand any of the code below. The point of this exercise is to make sure you have a working version of Python 3 and that you understand how to write and run code.

This assignment is due by the END of your week 2 lab.

```
import sys
print("YOUR NAME")
print(sys.version)
```

Replace YOUR NAME with your actual name. Yes, you need the quotation marks around your name. For example, my code would look something like.

```
import sys
print("Zachary Hutchinson")
print(sys.version)
```

Now run the code using the terminal. Take a screenshot of the output and upload it to Brightspace. Example using the code above.

Command Line

```
$ python hutchinson_lab0.py
Zachary Hutchinson
3.9.6 (default, Jun 30 2021, 10:22:16)
[GCC 11.1.0]
```

Yours will look a little different. Take a screenshot of the terminal lines showing you running the code and its output.
